The study of development in low-income countries is attracting more attention around the world than ever before. Yet until now there has been no comprehensive text that incorporates the huge strides made in the subject over the past decade. Development Economics does precisely that in a clear, rigorous, and elegant fashion. Debraj Ray, one of the most accomplished theorists in development economics today, presents in this book a synthesis of recent and older literature in the field and raises important questions that will help to set the agenda for future research. He covers such vital subjects as theories of economic growth, economic inequality, poverty and undernutrition, population growth, trade policy, and the markets for land, labor, and credit. A common point of view underlies the treatment of these subjects: that much of the development process can be understood by studying factors that impede the efficient and equitable functioning of markets. Diverse topics such as the new growth theory, moral hazard in land contracts, information-based theories of credit markets, and the macroeconomic implications of economic inequality come under this common methodological umbrella. The book takes the position that there is no single cause for economic progress, but that a combination of factors--among them the improvement of physical and human capital, the reduction of inequality, and institutions that enable the background flow of information essential to market performance--consistently favor development. Ray supports his arguments throughout with examples from around the world. The book assumes a knowledge of only introductory economics and explains sophisticated concepts in simple, direct language, keeping the use of mathematics to a minimum. Development Economics will be the definitive textbook in this subject for years to come. It will prove useful to researchers by showing intriguing connections among a wide variety of subjects that are rarely discussed together in the same book. And it will be an important resource for policy-makers, who increasingly find themselves dealing with complex issues of growth, inequality, poverty, and social welfare.

This textbook was written for senior undergraduates or master's students with a minimum introduction to economics, which assumes that the student has assimilated the general features of the approach defining economics as a social science. Consequently, any student or reader who is well grounded in the social science paradigm will readily assimilate this excellent introduction to development economics, which is distinguished by the solid, I would even say, jam-packed expertise of Debraj Ray. The author gives an excellent overview in the four-page preface, where he acknowledges the limitations of his work and prepares the reader well by conveying a transparent framework for absorbing the rather dense exposition that follows. There is in the second chapter a concise discussion of the meaning of economic development, which defines it as a multifaceted concept for which per capita income is a robust but significantly incomplete operational measure. Throughout the book, the basic pattern of discussion is consistent. The author discusses theory and data in dynamic--the order of the two is interchangeable--identifying and discriminating what is substantiated, imperfect, or defective in theory, as well as what is informative, unexplained, or wanting in data, and then whenever possible drawing implications or conclusions for economic policy. The ultimate goal of author's analysis is to limn the "structural characteristics" of economic development, building upon the fundamental assumption that the key determinants of economic performance are a cohort of salient variables that affect the efficient functioning of markets.
